

Verified Figures and Sources

- **Poultry production 2023:** 675,500 tons of chicken meat (carcass weight) 【159†L145-L153】. *Source:* CBS data as cited in the draft report (via Ynet). **Confidence:** Moderate (reported by draft/secondary but aligns with official trends).
- **Livestock antibiotic use:** Israel's farm antibiotic use $\approx 4\times$ the European average (2014 data, mg/PCU) 【89†L900-L904】. *Source:* Berman et al. 2023, citing a 2016 Hebrew Univ. thesis. Israel is thus among the highest globally, but not officially “#1 in Europe” (Israel isn't in ESVAC). **Confidence:** Moderate (peer-reviewed estimate).
- **Ammonia emissions (NH₃):** We found no primary data showing poultry $\approx 50\%$ of NH₃. Israel's official PRTR shows only minor NH₃ from farms (poultry facilities), and no source confirms a 50% share. *Conclusion:* Unverified. **Confidence:** Low (no official figure found).
- **Air-pollution damage (1.7 billion ₪/yr):** No independent source found. The 1.7 billion figure is cited in the draft/Ynet but not traceable to public data. *Conclusion:* Unverified. **Confidence:** Low.
- **Manure and carcasses (1M tons manure, 36k tons carcasses per year):** No official source found. These figures appear only in the draft report 【159†L171-L173】. Independent data on total poultry manure or carcasses in Israel was not located. *Conclusion:* Unverified. **Confidence:** Low.
- **Poultry consumption vs. guidelines:** 2023 consumption ≈ 52 kg/person 【159†L145-L153】, about $3\times$ higher than Health Ministry recommendations (implying $\sim 15\text{--}18$ kg/yr) 【159†L155-L158】. *Source:* Draft report citing CBS and a MoH guideline comparison. **Confidence:** Moderate (consistent with draft's statement).

Sources: Where available, figures are from primary/statistical sources or peer-reviewed studies 【159†L145-L153】 【89†L900-L904】. Items only in the draft (shelved report) remain “unverified” as per instructions.
